Your questions for discussion

Please add...

- How do researchers' comply with multiple DMP requirements (funders/publishers) if they vary?
- Above question also applies to related data sharing requirements in general. (Expected answer is that conflicting requirements are actually rare and solvable with a request for exception w/ evidence of conflict)
- Are there reasons beyond philosophy (good to increase openness of research) or mandates to create and share a DMP? What are the "selfish best interests" for making

DMPs (added by David Mellor- just thinking for ways to brainstorm for convincing more folks to do it):

- Better planning leads to better research (?)
- If the DMP is considered as a research output will it get a DOI or will it be linked to project proposal which will be attributed a DOI?

What can you contribute to?
